CLA-VAL 136E/D-01 & -03

On/Off Electrical Remote Control Valve

► Simple, Reliable and Accurate

- Completely Automatic Operation
- Easy Adjustment and Maintenance
- Quality Approved Materials
- World Wide Support

► CLA-VAL SERIES 136 Main Function

The CLA-VAL SERIES 136E/D Solenoid Control Valve is an On/Off Control Valve which either opens or closes receiving an electrical signal to the solenoid pilot control.

The CLA-VAL SERIES 136 Solenoid Control Valve is a Step by Step Control Valve.

► CLA-VAL 136E/D-01 & -03 Typical Application

The CLA-VAL 136E/D-01 & -03 Solenoid Control Valve is an On/Off Control Valve which either fully opens when the solenoid is energized or fully closes when the solenoid is de-energized.

The CLA-VAL 136E/D-01 & -03 is typically designed for industrial uses like control of process water for batching, mixing, washing or other on/off applications.

The CLA-VAL 136E/D-01 & -03 can also be used as a Level Control Valve by using a float switch sending an electrical signal to open or close the valve.

CLA-VAL 136E/D-01

On/Off Electrical Remote Control Valve

▶ Operating data

1.1 ▶ SOLENOID CONTROL FEATURE

Solenoid control (4) is a direct acting, 3-way solenoid control valve that applies or relieves pressure in the cover chamber of the main valve (1), providing the operation shown in the following table:

Solenoid valve (4)			Main valve (1)	
Electrical position	(4A)	(4B)	136E-01	136D-01
	311-D	311-C		
Energized	1 - 2	2 - 1	Open	Closed
De-energized	0 - 1	1 - 0	Closed	Open

1.2 ▶ CLOSING / OPENING SPEED CONTROL

Flow control valve (5) controls the closing and the opening speed of the main valve (1).

Flow control valve (5) adjustment: Turn the adjusting screw of control (5) clockwise to make the main valve (1) close and open slower.

Note: Do not close flow control valve (5) completely or the main valve (1) will not close or open (suggested initial setting of needle valve is 1/4 turn open).

1.3 ▶ (E*) EUROPEAN STANDARDS

ITEM (2) - Isolation ball valve:

The isolation ball valves are used to isolate the pilot system from main line pressure. These valves must be open during normal operation.

ITEM (3) - Strainer:

The strainer is installed in the pilot supply line to protect the pilot system from foreign particles. The strainer screen must be cleaned periodically.

1.4 ▶ OPTIONAL FEATURE

Suffix (F) - Remote sensing:

Solenoid supply pressure is obtained from an independent source; Independent operating pressure must be equal to or greater than pressure at the main valve inlet at all times (one-way flow). If the independent operating pressure is always greater than the pressure at inlet or outlet of main valve (1), this one can be used for two-way flow operation.

Suffix (H1) - 3-way solenoid valve drain:

The drain port of 3-way solenoid valve (4) is connected directly to the outlet of main valve (1), preventing any discharge of fluid pressure to the atmosphere. The lift of the main valve is therefore only created by the rate of flow and cannot any more be used for indicating the physical valve's opening position.

CLA-VAL 136E/D-01

On/Off Electrical Remote Control Valve

1.5 ▶ CHECK LIST FOR PROPER OPERATION

- System valves open upstream and downstream.
- Air removed from the main valve cover and pilot system at all high points.
- Isolation valves **(2A)** open.
- Periodical cleaning of the filter screen **(3)**.
- Flow control **(5)** at minimum $\frac{1}{4}$ turn open.
- Correct voltage to solenoid control **(4A)** or **(4B)**.
- Manual override valve **(4A)** or **(4B)** closed.

► Simple, Reliable and Accurate

► CLA-VAL SERIES 100 Main Function

The CLA-VAL 100-01 HYTROL Valve is a hydraulically operated, diaphragm actuated, globe or angle pattern valve.

It consists of three major components: body, diaphragm assembly and cover. The diaphragm assembly is the only moving part, guided top and bottom by a precision machined stem. The disc retainer and rubber disc form a drip-tight seal with the renewable seat when pressure is applied above the diaphragm (cover chamber).

The CLA-VAL 100-01 is the basic valve used in nearly in all CLA-VAL Automatic Control Valves.

There are 3 HYTROL body types:

NGE: New Globe Execution
 GE: Globe Execution
 AE: Angle Execution

► CLA-VAL 100-01 Principle of Operation

On/Off Control

Full Open Operation:
 When pressure in the cover chamber is relieved to a lower pressure or to atmosphere, the pressure inlet opens the valve.

On/Off Control

Tight Closing Operation:
 When pressure from the inlet pressure is applied to the cover chamber, the valve closes drip-tight.

CLA-VAL Controls

Modulating Control:
 The valve is pressure operating balanced. The CLA-VAL "Modulating" Controls will allow the valve to automatically compensate for pressure changes.

► DESCRIPTION

The CLA-VAL Model 100-01 HYTROL Valve is a main valve for CLA-VAL Automatic Control Valves. It is a hydraulically operated, diaphragm-actuated, globe or angle pattern valve.

This valve consists of three major components; body, diaphragm assembly, and cover. The diaphragm assembly is the only moving part. The diaphragm assembly uses a diaphragm of nylon fabric bonded with synthetic rubber. A synthetic rubber disc, contained on three and one half sides by a disc retainer and disc guide, forms a seal with the valve seat when pressure is applied above the diaphragm. The diaphragm assembly forms a sealed chamber in the upper portion of the valve, separating operating pressure from line pressure.

Illustration type GE

► INSTALLATION

1. Before valve is installed, pipe lines should be flushed of all chips, scale and foreign matter.
2. It is recommended that either gate or block valves be installed on both ends of the 100-01 HYTROL Valve to facilitate isolating the valve for preventive maintenance and repairs.
3. Place the valve in the line with flow through the valve in the direction indicated on the inlet nameplate. (See "Flow Direction" Section)
4. Allow sufficient room around valve to make adjustments and for disassembly.
5. CLA-VAL 100-01 HYTROL Valves operate with maximum efficiency when mounted in horizontal piping with the cover UP, however, other positions are acceptable. Due to size and weight of the cover and internal components of 8 inch and larger valves, installation with the cover UP is advisable. This makes internal parts readily accessible for periodic inspection.
6. Caution must be taken in the installation of this valve to insure that galvanic and/or electrolytic action does not take place. The proper use of dielectric fittings and gaskets are required in all systems using dissimilar metals.
7. If a pilot control system is installed on the 100-01 HYTROL Valve, use care to prevent damage. If it is necessary to remove fittings or components, be sure they are kept clean and replaced exactly as they were.
8. After the valve is installed and the system is first pressurized, vent air from the cover chamber and pilot system tubing by loosening fittings at all high points.

► FLOW DIRECTION

The flow through the 100-01 HYTROL Valve can be in one of two directions. When flow is "up-and-over the seat," it is in "normal" flow and the valve will fail in the open position. When flow is "over the seat-and down," it is in "reverse" flow and the valve will fail in the closed position. There are no permanent flow arrow markings.

The valve must be installed according to nameplate data.

BRIDGEWALL INDICATOR
(cast into side of valve body)

► RECOMMENDED TOOLS

1. Three pressure gauges with ranges suitable to the installation to be put at HYTROL inlet, outlet and cover connections.
2. CLA-VAL Model X101 Valve Position Indicator. This provides visual indication of valve position without disassembly of valve.
3. Other items are: suitable hand tools such as screwdrivers, wrenches, etc. soft jawed (brass or aluminum) vise 400 grit wet or dry sandpaper and water for cleaning.

▶ PRINCIPLES OF OPERATION

(Illustration type GE)

On/Off Control

Tight Closing Operation

When pressure from the valve inlet (or an equivalent independent operating pressure) is applied to the diaphragm chamber the valve closes drip-tight.

On/Off Control

Full Open Operation

When pressure in diaphragm chamber is relieved to a zone of lower pressure (usually atmosphere) the line pressure (5 psi Min.) at the valve inlet opens the valve.

CLA-VAL control

Modulating Action

Valve modulates when diaphragm pressure is held at an intermediate point between inlet and discharge pressure. With the use of a CLA-VAL. "modulating control," which reacts to line pressure changes, the pressure above the diaphragm is varied, allowing the valve to throttle and compensate for the change.

▶ THREE CHECKS

The 100-01 HYTROL Valve has only one moving part (the diaphragm and disc assembly). So, there are only three major types of problems to be considered.

First: Valve is stuck - that is, the diaphragm assembly is not free to move through a full stroke either from open to close or vice versa.

Second: Valve is free to move and can't close because of a worn out diaphragm.

Third: Valve leaks even though it is free to move and the diaphragm isn't leaking.

CAUTION! Care should be taken when doing the troubleshooting checks on the 100-01 HYTROL Valve. These checks do require the valve to open fully. This will either allow a high flow rate through the valve, or the downstream pressure will quickly increase to the inlet pressure. In some cases, this can be very harmful. Where this is the case, and there are no block valves in the system to protect the downstream piping, it should be realized that **the valve cannot be serviced under pressure**. Steps should be taken to remedy this situation before proceeding any further.

Valve size (DN)		COVER CHAMBER CAPACITY (liquid Volume displaced when valve opens)		STEM TRAVEL (Fully Open To Fully closed)	
NGE	GE	Liters	Gallons	mm	Inches
50	32 - 40	0,07	0,020	10,0	0,40

TYTAN		Liters	Gallons	mm	Inches
TYTAN-S	600 - 800	107,00	28,27	154,6	6,0
TYTAN-M	900 - 1000	159,00	42,00	190,0	7,5
TYTAN-L	900 - 1200	340,00	90,00	216,0	8,5

DIAPHRAGM CHECK (#1)

1. Shut off pressure to the HYTROL Valve by slowly closing upstream and downstream isolation valves. **SEE CAUTION!**
2. Disconnect or close all pilot control lines to the valve cover and leave only one fitting in highest point of cover open to atmosphere.
3. With the cover vented to atmosphere, slowly open upstream isolation valve to allow some pressure into the HYTROL Valve body. Observe the open cover tapping for signs of continuous flow. It is not necessary to fully open isolating valve. Volume in cover chamber capacity chart will be displaced as valve moves to open position. Allow sufficient time for diaphragm assembly to shift positions. If there is no continuous flow, you can be quite certain the diaphragm is sound and the diaphragm assembly is tight. If the fluid appears to flow continuously this is a good reason to believe the diaphragm is either damaged or it is loose on the stem. In either case, this is sufficient cause to remove the valve cover and investigate the leakage. (See "Maintenance" Section for procedure.)

FREEDOM OF MOVEMENT CHECK (#2)

4. Determining the HYTROL Valve's freedom of movement can be done by one of two methods.
5. For most valves it can be done after completing Diaphragm Check (Steps 1., 2., and 3.). **SEE CAUTION!** At the end of step 3. the valve should be fully open.
6. If the valve has a CLA-VAL X101 Position Indicator, observe the indicator to see that the valve opens wide. Mark the point of maximum opening.
7. Re-connect enough of the control system to permit the application of inlet pressure to the cover. Open pilot system cock so pressure flows from the inlet into the cover.
8. While pressure is building up in the cover, the valve should close smoothly. There is a hesitation in every HYTROL Valve closure, which can be mistaken for a mechanical bind. The stem will appear to stop moving very briefly before going to the closed position. This slight pause is caused by the diaphragm flexing at a particular point in the valve's travel and is not caused by a mechanical bind.
9. When closed, a mark should be made on the X101 Valve position indicator corresponding to the "closed" position. The distance between the two marks should be approximately the stem travel shown in chart.
10. If the stroke is different than that shown in stem travel chart this is a good reason to believe something is mechanically restricting the stroke of the valve at one end of its travel. If the flow does not stop through the valve when in the indicated "closed" position, the obstruction probably is between the disc and the seat. If the flow does stop, then the obstruction is more likely in the cover. In either case, the cover must be removed, and the obstruction located and removed. The stem should also be checked for scale build-up. (See "Maintenance, section for procedure.)
11. For valves 6" and smaller, the HYTROL Valve's freedom of movement check can also be done after all pressure is removed from the valve. **SEE CAUTION!** After closing inlet and outlet isolation valves and bleeding pressure from the valve, check that the cover chamber and the body are temporarily vented to atmosphere. Insert fabricated tool into threaded hole in top of valve stem, and lift the diaphragm assembly manually. Note any roughness. The diaphragm assembly should move smoothly throughout entire valve stroke. The tool is fabricated from rod that is threaded on one end to fit valve stem and has a "T" bar handle of some kind on the other end for easy gripping. (See chart in Step 4 of "Disassembly" Section.)
12. Place marks on this diaphragm assembly lifting tool when the valve is closed and when manually positioned open. The distance between the two marks should be approximately the stem travel shown in stem travel chart. If the stroke is different than that shown, there is a good reason to believe something is mechanically restricting the stroke of the valve. The cover must be removed, and the obstruction located and removed. The stem should also be checked for scale build-up. (See "Maintenance, section for procedure.)

TIGHT SEALING CHECK (#3)

13. Test for seat leakage after completing checks #1 & #2 (Steps 1. to 12.). **SEE CAUTION!** Close the isolation valve downstream of the HYTROL Valve. Apply inlet pressure to the cover of the valve, wait until it closes. Install a pressure gauge between the two closed valves using one of the two ports in the outlet side of the HYTROL. Watch the pressure gauge. If the pressure begins to climb, then either the downstream isolation valve is permitting pressure to creep back, or the HYTROL is allowing pressure to go through it. Usually the pressure at the HYTROL inlet will be higher than on the isolation valve discharge, so if the pressure goes up to the inlet pressure, you can be sure the HYTROL is leaking. Install another gauge downstream of isolating valve. If the pressure between the valves only goes up to the pressure on the isolation valve discharge, the HYTROL Valve is holding tight, and it was just the isolation valve leaking.

▶ TROUBLESHOOTING

The following troubleshooting information deals strictly with the Model 100-01 HYTROL Valve. This assumes that all other components of the pilot control system have been checked out and are in proper working condition. (See appropriate sections in Technical Manual for complete valve).

All trouble shooting is possible without removing the valve from the line or removing the cover. It is highly recommended to permanently install a Model X101 Valve Position Indicator and three gauges in unused HYTROL inlet, outlet and cover connections.

SYMPTOM	PROBABLE CAUSE	REMEDY
Fails to close	Closed isolation valves in control system, or in main line.	Open Isolation valves.
	Lack of cover chamber pressure.	Check upstream pressure, pilot system, strainer, tubing, valves, or needle valves for obstruction.
	Diaphragm damaged. (See Diaphragm Check)	Replace diaphragm.
	Diaphragm assembly inoperative. Corrosion or excessive scale build-up on valve stem. (See Freedom of Movement Check)	Clean and polish stem. Inspect and replace any damaged or badly eroded part.
	Mechanical obstruction. Object lodged in valve. (See Freedom of Movement Check)	Remove obstruction.
	Worn disc. (See Tight Sealing Check)	Replace disc.
	Badly scored seat. (See Tight Sealing Check)	Replace seat.
Fails to open	Closed upstream and/or downstream isolation valves in main line.	Open isolation valves.
	Insufficient line pressure.	Check upstream pressure. (Minimum 5 psi flowing line pressure differential.)
	Diaphragm assembly inoperative. Corrosion or excessive build-up on valve stem. (See Freedom of Movement Check)	Clean and polish stem. Inspect and replace any damaged or badly eroded part.
	Diaphragm damaged. (For valves in "reverse flow" only)	Replace diaphragm.

After checking out probable causes and remedies, the following three checks can be used to diagnose the nature of the problem before maintenance is started. They must be done in the order shown.

► MAINTENANCE

PREVENTATIVE MAINTENANCE

The CLA-VAL Model 100-01 HYTROL Valve requires no lubrication or packing and a minimum of maintenance. However, a periodic inspection schedule should be established to determine how the operating conditions of the system are affecting the valve. The effect of these actions must be determined by inspection.

DISASSEMBLY

Inspection or maintenance can be accomplished without removing the valve from the line. Repair kits with new diaphragm and disc are recommended to be on hand before work begins.

: Maintenance personnel can be injured and equipment damaged if disassembly is attempted with pressure in the valve. **SEE CAUTION!**

1. Close upstream and downstream isolation valves **and independent operating pressure when used** to shut off all pressure to the valve.
2. Loosen tube fittings in the pilot system to remove pressure from valve body and cover chamber. After pressure has been released from the valve, use care to remove the controls and tubing. Note and sketch position of tubing and controls for re-assembly. The schematic in front of the Technical Manual can be used as a guide when reassembling pilot system.
3. Remove cover nuts and remove cover. If the valve has been in service for any length of time, chances are the cover will have to be loosened by driving upward along the edge of the cover with a **dull** cold chisel.

On 6" and smaller valves block and tackle or a power hoist can be used to lift valve cover by inserting proper size eye bolt in place of the center cover plug. On 8" and larger valves there are 4 holes (5/8" - 11 size) where jacking screws and/or eye bolts may be inserted for lifting purposes. **Pull cover straight up** to keep from damaging the integral seat bearing and stem.

- Remove the diaphragm and disc assembly from the valve body. With smaller valves this can be accomplished by hand by **pulling straight up on the stem so as not to damage the seat bearing**. On large valves, an eye bolt of proper size can be installed in the stem and the diaphragm assembly can be then lifted with a block and tackle or power hoist. Take care not to damage the stem or bearings. The valve won't work if these are damaged.

VALVE STEM THREAD SIZE		
Valve size		Thread Size (Internal)
NGE	GE / AE	
DN 50 - 80	DN 32 - 65	10 - 32 UNF
DN 100 - 150	DN 80 - 100	1/4 - 28 UNF
DN 200 - 400	DN 150 - 350	3/8 - 24 UNF
DN 500 - 600	DN 400	1/2 - 20 UNF
TYTAN-S	DN 600 - 800	1/2 - 20 UNF
TYTAN-M	DN 900 - 1000	M20
TYTAN-L	DN 900 - 1200	M20

- The next item to remove is the stem nut. Examine the stem threads above the nut for signs of mineral deposits or corrosion. If the threads are not clean, use a wire brush to remove as much of the residue as possible. Attach a good fitting wrench to the nut and give it a sharp "rap" rather than a steady pull. Usually several blows are sufficient to loosen the nut for further removal. On the smaller valves, the entire diaphragm assembly can be held by the stem in a vise **equipped with soft brass jaws** before removing the stem nut.

The use of a pipe wrench or a vise without soft brass jaws scars the fine finish on the stem. No amount of careful dressing can restore the stem to its original condition. Damage to the finish of the stem can cause the stem to bind in the bearings and the valve will not open or close.

- After the stem nut has been removed, the diaphragm assembly breaks down into its component parts. Removal of the disc from the disc retainer can be a problem if the valve has been in service for a long time. Using two screwdrivers inserted along the outside edge of the disc usually will accomplish its removal. Care should be taken to preserve the spacer washers in water, particularly if no new ones are available for re-assembly.
- The only part left in the valve body is the seat which ordinarily does not require removal. Careful cleaning and polishing of inside and outside surfaces with 400 wet/dry sandpaper will usually restore the seat's sharp edge. If, however, it is badly worn and replacement is necessary, it can be easily removed.

Seats in valve sizes 1 1/4" through 6" are threaded into the valve body. They can be removed with accessory X109 Seat Removing Tool available from the factory. On 8" and larger valves, the seat is held in place by flat head machine screws. Use a tight-fitting, long shank screwdriver to prevent damage to seat screws. If upon removal of the screws the seat cannot be lifted out, it will be necessary to use a piece of angle or channel iron with a hole drilled in the center. Place it across the body so a long stud can be inserted through the center hole in the seat and the hole in the angle iron. By tightening the nut a uniform upward force is exerted on the seat for removal.

Note: Do not lift up on the end of the angle iron as this may force the integral bearing out of alignment, causing the stem to bind.

INSPECTION OF PARTS

After the valve has been disassembled, each part should be examined carefully for signs of wear, corrosion, or any other abnormal condition. Usually, it is a good idea to replace the rubber parts (diaphragm and disc) unless they are free of signs of wear. These are available in a repair kit. Any other parts which appear doubtful should be replaced. **WHEN ORDERING PARTS, BE SURE TO GIVE COMPLETE NAMEPLATE DATA, ITEM NUMBER AND DESCRIPTION.**

Note: If a new disc isn't available, the existing disc can be turned over, exposing the unused surface for contact with the seat. The disc should be replaced as soon as practical.

REASSEMBLY

1. Reassembly is the reverse of the disassembly procedure. If a new disc has been installed, it may require a different number of spacer washers to obtain the right amount of "grip" on the disc. When the diaphragm assembly has been tightened to a point where the diaphragm cannot be twisted, the disc should be compressed very slightly by the disc guide. Excessive compression should be avoided. Use just enough spacer washers to hold the disc firmly without noticeable compression.
2. **MAKE SURE THE STEM NUT IS VERY TIGHT.** Attach a good fitting wrench to the nut and give it a sharp "rap" rather than a steady pull. Usually several blows are sufficient to tighten the stem nut for final tightening. Failure to do so could allow the diaphragm to pull loose and tear when subjected to pressure.
3. Carefully install the diaphragm assembly by lowering the stem through the seat bearing. Take care not to damage the stem or bearing. Line up the diaphragm holes with the stud or bolt holes on the body. On larger valves with studs, it may be necessary to hold the diaphragm assembly up part way while putting the diaphragm over the studs.
4. Put spring in place and replace cover. Make sure diaphragm is lying smooth under the cover.
5. Tighten cover nuts firmly using a cross-over pattern until all nuts are tight.
6. Test HYTROL Valve before re-installing pilot valve system.

TEST PROCEDURE AFTER VALVE ASSEMBLY

There are a few simple tests which can be made in the field to make sure the HYTROL Valve has been assembled properly. Do these before installing pilot system and returning valve to service. These are similar to the three troubleshooting tests.

- 1- Check the diaphragm assembly for freedom of movement after all pressure is removed from the valve. **SEE CAUTION!** Insert fabricated tool into threaded hole in top of valve stem, and lift the diaphragm assembly manually. Note any roughness, sticking or grabbing. The diaphragm assembly should move smoothly throughout entire valve stroke. The tool is fabricated from rod that is threaded on one end to fit valve stem (See chart in Step 4 of "Disassembly" section.) and has a "T" Bar handle of some kind on the other end for easy gripping.
Place marks on this diaphragm assembly lifting tool when the valve is closed and when manually positioned open. The distance between the two marks should be approximately the stem travel shown in stem travel chart. (See "Freedom of Movement Check" section.) If the stroke is different than that shown, there is a good reason to believe something is mechanically restricting the stroke of the valve. The cover must be removed, the obstruction located and removed. (See "Maintenance" Section for procedure.) Due to the weight of the diaphragm assembly this procedure is not possible on valves 8" and larger. on these valves, the same determination can be made by carefully introducing a low pressure-less than five psi) into the valve body with the cover vented. **SEE CAUTION!** Looking in cover center hole see the diaphragm assembly lift easily without hesitation, and then settle back easily when the pressure is removed.
- 2- To check the valve for drip-tight closure, a line should be connected from the inlet to the cover, and pressure applied at the inlet of the valve. If properly assembled, the valve should hold tight with as low as ten PSI at the inlet. See "Tight Sealing Check" section.)
- 3- With the line connected from the inlet to the cover, apply full working pressure to the inlet. Check all around the cover for any leaks. Re-tighten cover nuts if necessary to stop leaks past the diaphragm.
- 4- Remove pressure, then re-install the pilot system and tubing exactly as it was prior to removal. **Bleed air from all high points.**
- 5- Follow steps under "Start-Up and Adjustment" Section in Technical Manual for returning complete valve back to service.

Filtere X43

Ce filtre empêche tout corps étranger de pénétrer dans le circuit d'asservissement.

Il est recommandé de nettoyer périodiquement la cartouche du filtre.

Strainer X43

The strainer is installed in the pilot supply line to protect the pilot system from foreign particles. The strainer screen must be cleaned periodically.

Filter X43

Der Filter verhindert das Eindringen von Fremdkörpern ins Steuersystem.

Das Sieb des Filters muss von Zeit zu Zeit gereinigt werden.

▶ ELECTROVANNES POUR APPLICATIONS GENERALES 3/2 - COMMANDE DIRECTE

Les électrovannes sont des composants électromécaniques pour le contrôle des fluides. L'ouverture ou la fermeture d'un ou plusieurs orifices dans le corps de valve permet le passage du fluide. La bobine (ou solénoïde) convertit un signal électrique en une force mécanique qui, à son tour, actionne un noyau mobile équipé de joints de clapets permettant d'obturer ou d'ouvrir un orifice (buse). Les électrovannes sont généralement composées de 3 éléments:

- Le corps de vanne (y compris la partie pilote)
- La bobine (ou l'ensemble boîtier/bobine intégré)
- Le boîtier (ou l'ensemble écrou/rondelle nécessaire à la fixation)

Les 3 éléments modulaires sont la plupart du temps interchangeables c'est à dire qu'un corps de valve peut être utilisé avec un certain nombre de combinaisons boîtier/bobine différentes.

Fig. 1

▶ ELECTROVANNES A COMMANDE DIRECTE (FIG. 1)

La force électromagnétique est utilisée directement pour ouvrir ou fermer le passage du fluide au niveau du joint de clapet du noyau mobile. Les performances sont limitées (pression/diamètre de passage) par les caractéristiques des bobines. La gamme de pression des électrovannes à commande directe couvre une plage de zéro à la valeur maximum.

▶ DIMENSIONS

▶ CARACTÉRISTIQUES TECHNIQUES

Fonction:	Electrovanne 3/2 universelle: fermée ou ouverte hors tension Ouverte: Hors tension  Fermée: Hors tension 
Principe de construction:	Electrovanne à clapet à commande directe
Raccords:	G 1/8
Position de montage:	Indifférente
Matière:	Corps en laiton nickelé ou acier inox SS316. Pièces interne en acier inoxydable
Commande manuelle:	<ul style="list-style-type: none"> La commande manuelle permet de simuler la mise sous tension de l'électrovanne. La commande manuelle située dans le corps de l'électrovanne est activé par une rotation de la vis dans le sens horaire (1/4 tour).
Pression max d'utilisation:	<ul style="list-style-type: none"> dP min = 0 bar dP max = 30 bar
Temps de réponse (pour air):	<ul style="list-style-type: none"> Courant continu: à l'enclenchement 15 ms - au déclenchement 10 ms Courant alternatif: à l'enclenchement 10 ms - au déclenchement 10 ms
Nombres de manœuvre:	Jusqu'à 2000 manœuvres par minute
Fluides:	Air sec ou lubrifié, gaz inertes, fluides non corrosifs, huiles minérales et fuel viscosité max. 76 cSt (10°E)
Températures ambiantes:	-10°C à +50°C
Parties électriques:	Bobine standard 2995/481865 enrobée de matière synthétique. Raccordement par fiche DIN 43650 A (2P + T). Degré de protection IP65
Degré de protection:	Boîtier en version IP67, parties électriques en version anti-déflagrante disponible sur demande
Tensions disponibles:	CC: 12/24/48/110V - CA/50Hz: 24/48/110/220-30
Classe de matière isolante:	Classe F 155°C
Durée d'enclenchement:	Bobines conçues pour enclenchement permanent
Consommation électrique:	8-14 W
Tolérance de tension:	-10% à +10% de Un

▶ SPECIFICATIONS POUR BOBINE STANDARD

Ces bobines sont conçues en conformité avec les normes de sécurité CEI/CENELEC et répondent aux exigences de la directive européenne basse tension 73/23/EC.

Spécifications	Degré de protection	Classe d'isolation	Raccordement électrique	Température ambiante	Consommation électrique			
					DC		AC	
					Pn (chaud)	P (froid) 20°C	Pn (maintien)	Attract. froid
Standard	IP65 selon IEC/EN 60529 (avec fiche)	F 155°C/F	Raccordement 2 P + T selon DIN 43650 A	-40°C à +50°C-	9 W	12 W	8 W	26 VA / (9 W)

▶ OPTION: PARTIES ÉLECTRIQUES II 2 G EEX DM IIC T4

Parties électriques anti-explosion avec enveloppe antidéflagrante / encapsulage "dm"

Selon la directive ATEX 94/9/CE en conformité avec les normes EN 50014, EN 50018, EN 50028 et EN 50281-1-1.

Application:

Commande d'électrovalves destinées à être utilisées dans des milieux présentant un danger d'explosion gazeux en zones 1, ou zones 2, (ATEX: Groupe II, catégories d'appareils 2G ou 3G).

L'enveloppe de ces parties électriques anti-explosion "dm" est entièrement en matières synthétique. Toutes les parties métalliques extérieures, en contact avec l'atmosphère, sont en acier inoxydable. Les joints et o-rings intégrés assurent un degré de protection IP67. Donc ces produits sont parfaitement conçus pour des utilisations non seulement en atmosphères explosibles mais également pour un environnement agressif dans l'industrie Chimique, Pétrochimique ou Raffineries (CPR). L'encombrement réduit permet un montage facile dans les endroits peu accessibles.

Caractéristiques:

Enroulement (fil de cuivre Classe d'isolation H) et armature métallique sont surmoulés avec une matière synthétique de Classe H et correspond à la protection "m". La boîte de raccordement et couvercle sont en matière synthétique de haute qualité (Classe H) pour satisfaire les exigences de la protection antidéflagrante "d" selon EN 50018. Le boîtier est livré avec presse-étoupe M20x1.5 certifié pour utilisation "d". Un fusible thermique approprié, assurant le non-dépassement éventuel de la température maximale de surface T5/T4 et un varistor empêchant des pics des tensions lors du déclenchement, sont enrobées dans une résine Epoxy de Classe H.

Référence:	495905				
Homologation / Type de protection:	LCIE 02 ATEX 6451 X Gaz II 2 G - EEx dm IIC T4				
Degré de protection:	IP67				
Température ambiante:	-40 à +65 °C				
Classe d'isolation:	H (180 °)				
Raccordement électrique:	Le raccordement électrique se fait dans la chambre de raccordement du boîtier sur un bornier facilement accessible. L'introduction du câble (Ø min 7 mm, Ø max. 9 mm, section max. 2.5 mm ²) dans la chambre de raccordement passe par le presse-étoupe M20x1.5 intégré au boîtier.				
Consommation électrique:	CC	P_n (chaud)	8 W	P (froid) 20°C	9 W
	CA	P_n (maintien)	8 W	Attraction froid	9 W
Tensions nominales:	6 à 110 VCC 12 à 240 VCA				
Tolérances de tension:	± 10 % de U _n				
Durée d'enclenchement:	Parties électriques conçue pour un enclenchement permanent (ED 100%)
